## Wolman-Alzheimer Analysis

### Dataset:

We have two RSS Feeds to analyze the activities for Wolman disease and Alzheimer disease. I created two data frame one for Wolman disease and second one for Alzheimer's disease out of the data I collected from the give link. Wolman data Frame consists of 10 columns and 10 rows and Alzheimer's data frame consists of 10 columns and 23 rows. I selected 6 columns for my analysis i.e 'title', 'summary', 'summary\_detail', 'id', 'published'.

### My Analysis:

#### Wolman:

- As per the given dataset most number of activities for Wolman Disease are published in the year 2015. The activities were relatively more before the year 2012 but gradually dropped to zero and slowly it got high up in the year 2015 .

#### Alzheimer:

- When I analyzed the Alzheimer data plot it demonstrated that there were more activities in September 2020 than in October 2020 related to Alzheimer disease.
